2. Our Results
3. Problems

Bases

Let $G \leq \mathrm{Sym}(\Omega)$ with $|\Omega| < \infty$.

- Base: $\Delta \subset \Omega$ such that the point-wise stabiliser $G_{(\Delta)} = 1$.
- Base size: minimal cardinality of bases, denoted by $b(G)$.
- Base size set: a base Δ such that $|\Delta| = b(G)$.

Bases

Let $G \leq \mathrm{Sym}(\Omega)$ with $|\Omega| < \infty$.

- Base: $\Delta \subset \Omega$ such that the point-wise stabiliser $G_{(\Delta)} = 1$.
- Base size: minimal cardinality of bases, denoted by $b(G)$.
- Base size set: a base Δ such that $|\Delta| = b(G)$.

With the natural actions,

- $b(S_n) = n - 1$;
- $b(A_n) = n - 2$;
- $b(\mathrm{GL}_n(q)) = n$, and a base size set is exactly a basis of $\mathbb{F}_q^n$ over $\mathbb{F}_q$.

Bases

Let $G \leq \mathrm{Sym}(\Omega)$ with $|\Omega| < \infty$.

- Base: $\Delta \subset \Omega$ such that the point-wise stabiliser $G_{(\Delta)} = 1$.
- Base size: minimal cardinality of bases, denoted by $b(G)$.
- Base size set: a base Δ such that $|\Delta| = b(G)$.

With the natural actions,

- $b(S_n) = n - 1$;
- $b(A_n) = n - 2$;
- $b(\mathrm{GL}_n(q)) = n$, and a base size set is exactly a basis of $\mathbb{F}_q^n$ over $\mathbb{F}_q$.

Suppose G is transitive.

- G is regular $\iff b(G) = 1$.
- If G is Frobenius then $b(G) = 2$.
- If G is sharply k-transitive then $b(G) = k$.

Almost simple primitive groups

Recall that $G \leq \mathrm{Sym}(\Omega)$ is called primitive if

- G is transitive, and
- G_α is maximal in G.

Almost simple primitive groups

Recall that $G \leq \mathrm{Sym}(\Omega)$ is called primitive if

- G is transitive, and
- G_α is maximal in G.

Theorem (O'Nan-Scott).

Let G be a primitive group. Then G is of one of the following types: HA, AS, HS, HC, PA, TW, SD, CD.

Almost simple primitive groups

Recall that $G \leq \mathrm{Sym}(\Omega)$ is called primitive if

- G is transitive, and
- G_α is maximal in G.

Theorem (O'Nan-Scott).

Let G be a primitive group. Then G is of one of the following types: HA, AS, HS, HC, PA, TW, SD, CD.

A group G is called almost simple if

$$\mathrm{soc}(G) = T \cong \mathrm{Inn}(T) \lesssim G \lesssim \mathrm{Aut}(T)$$

for some non-abelian simple group T.

Base sizes

Definition.

Let $G \leq \mathrm{Sym}(\Omega)$ be an almost simple primitive group with socle G_0 and stabiliser H. Then we say G is standard if one of the following holds:

1. $G_0 = A_n$ and Ω is an orbit of subsets or partitions of $\{1, \ldots, n\}$; or
2. G_0 is a classical group with natural module V and either Ω is an orbit of subspaces (or pairs of subspaces) of V; or
3. $G_0 = \mathrm{Sp}_n(2^f)$ and $H \cap G_0 = O_n^{\pm}(2^f)$.

Base sizes

Definition.

Let $G \leq \mathrm{Sym}(\Omega)$ be an almost simple primitive group with socle G_0 and stabiliser H. Then we say G is standard if one of the following holds:

1. $G_0 = A_n$ and Ω is an orbit of subsets or partitions of $\{1, \dots, n\}$; or
2. G_0 is a classical group with natural module V and either Ω is an orbit of subspaces (or pairs of subspaces) of V; or
3. $G_0 = \mathrm{Sp}_n(2^f)$ and $H \cap G_0 = O_n^{\pm}(2^f)$.

Let G be almost simple and primitive.

- Cameron-Kantor 1993 [6]: conjectured $b(G) \leq c$ if G is non-standard.
- Liebeck-Shalev 1999 [9]: c exists.
- Burness-Liebeck-Shalev 2009 [4]: $c = 7$ is optimal (M_{24}).
- Burness 2018 [1]: determined non-standard groups with $b(G) = 6$.

Soluble groups

Let G be primitive.

- Seress 1996 [10]: $b(G) \leq 4$ if G is soluble.
- Burness 2020+ [2]: $b(G) \leq 5$ if G_α is soluble.
- Burness-Shalev 2020+ [5]: if G is not of types HA or TW, and every $G_{\alpha\beta}$ is soluble, then $b(G) \leq 6$.

Saxl graphs

Saxl first proposed determining all primitive groups G with $b(G) = 2$.

Definition (Saxl graphs [3]).

Let G be a permutation group acting on Ω. Then the Saxl graph $\Sigma(G)$ is the graph such that

- the vertex set is Ω;
- $\alpha \sim \beta$ if $\{\alpha, \beta\}$ is a base.

Saxl graphs

Saxl first proposed determining all primitive groups G with $b(G) = 2$.

Definition (Saxl graphs [3]).

Let G be a permutation group acting on Ω. Then the Saxl graph $\Sigma(G)$ is the graph such that

- the vertex set is Ω;
- $\alpha \sim \beta$ if $\{\alpha, \beta\}$ is a base.

We have

- $b(G) \geq 3 \implies \Sigma(G)$ empty;
- $b(G) = 1$ and G transitive $\implies \Sigma(G)$ complete.

Example.

Suppose $G = A_5$ and $G_\alpha = S_3$. Then $\overline{\Sigma(G)}$ is Petersen.

First observations

Proposition.

Suppose G is transitive with $b(G) = 2$ and $\Sigma(G)$ is the Saxl graph of G.

1. $\Sigma(G)$ is G-vertex-transitive.
2. $\Sigma(G)$ is connected if G is primitive.
3. $\Sigma(G)$ is complete if and only if G is Frobenius.
4. $\Sigma(G)$ is G-arc-semiregular.

First observations

Proposition.

Suppose G is transitive with $b(G) = 2$ and $\Sigma(G)$ is the Saxl graph of G.

1. $\Sigma(G)$ is G-vertex-transitive.
2. $\Sigma(G)$ is connected if G is primitive.
3. $\Sigma(G)$ is complete if and only if G is Frobenius.
4. $\Sigma(G)$ is G-arc-semiregular.

Indeed, $\Sigma(G)$ is the union of all regular orbital graphs of G.

Burness-Giudici Conjecture

Conjecture (Burness-Giudici 2020 [3]).

Let G be primitive and $b(G) = 2$. Then any two vertices in $\Sigma(G)$ has a common neighbour.

Note that if $\mathrm{val}(\Sigma(G)) > \frac{1}{2}|\Omega|$ then the conjecture is verified. This gives a motivation to study the valency problems.

$\mathrm{val}(\Sigma(G)) = r|H|$

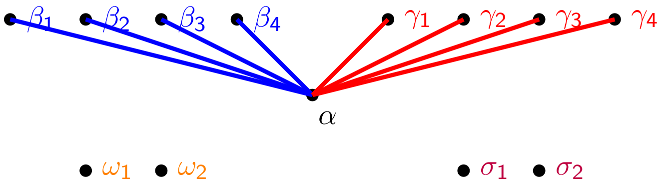
Proposition.

Suppose G is transitive with $b(G) = 2$ and $\Sigma(G)$ is the Saxl graph of G. Then $\Sigma(G)$ has valency $r|H|$, where H is the point stabiliser and r is the number of regular suborbits of G.

$\mathrm{val}(\Sigma(G)) = r|H|$

Proposition.

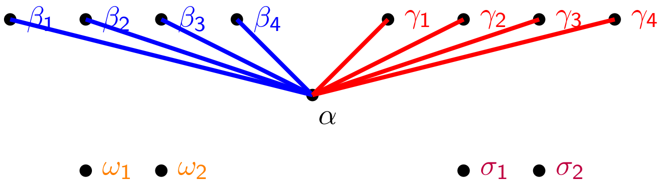
Suppose G is transitive with $b(G) = 2$ and $\Sigma(G)$ is the Saxl graph of G. Then $\Sigma(G)$ has valency $r|H|$, where H is the point stabiliser and r is the number of regular suborbits of G.



$\mathrm{val}(\Sigma(G)) = r|H|$

Proposition.

Suppose G is transitive with $b(G) = 2$ and $\Sigma(G)$ is the Saxl graph of G. Then $\Sigma(G)$ has valency $r|H|$, where H is the point stabiliser and r is the number of regular suborbits of G.



By $\mathrm{val}(G, H)$ we mean the valency of the Saxl graph of G with stabiliser H. In particular, $|H|$ divides $\mathrm{val}(G, H)$.

Outline

1. Backgrounds
2. Our Results
3. Problems

Frobenius groups

Recall that a group H is called Frobenius if there exists a non-trivial proper subgroup $L < H$ such that $L \cap L^h = 1$ for any $h \in H \setminus L$.

- Frobenius complement: L.
- Frobenius kernel: the subgroup K comprising the identity element and those elements that are not in any conjugate of L.

Frobenius groups

Recall that a group H is called Frobenius if there exists a non-trivial proper subgroup $L < H$ such that $L \cap L^h = 1$ for any $h \in H \setminus L$.

- Frobenius complement: L.
- Frobenius kernel: the subgroup K comprising the identity element and those elements that are not in any conjugate of L.
- $H = K{:}L$.
- If K is cyclic, then so does L.

Frobenius groups with cyclic kernel

Theorem (Chen-H. 2020+).

Suppose G is a finite primitive permutation group with stabiliser H, where $H = K{:}L$ is Frobenius with cyclic kernel K. Write $L = \langle y \rangle$. Then

$$\mathrm{val}(G,H) = |G:H| + |K| - 1 + \frac{|K|}{|L|} \sum_{1 \neq d \mid |L|} \mu(d) |N_G(\langle y^{\frac{|L|}{d}} \rangle)|,$$

where μ is the Möbius function.

Alternating and symmetric groups

This can be applied to various problems. For example

Corollary.

Let $G = S_p$ and $H = \mathrm{AGL}_1(p) \cong \mathbb{Z}_p{:}\mathbb{Z}_{p-1}$ with $p \geq 5$ a prime. Then

$$\mathrm{val}(G, H) = (p-2)! + p - 1 + p \sum_{1 \neq d \mid (p-1)} \mu(d)\phi(d) d^{\frac{p-1}{d}-1} \left(\frac{p-1}{d} - 1\right)!.$$

Corollary.

Let $G = A_p$ and $H = \mathrm{AGL}_1(p) \cap A_p \cong \mathbb{Z}_p{:}\mathbb{Z}_{(p-1)/2}$ with $p \geq 5$ a prime and $p \neq 7, 11, 17, 23$. Then

$$\mathrm{val}(G, H) = (p-2)! + p - 1 + p \sum_{1 \neq d \mid \frac{p-1}{2}} \mu(d)\phi(d) d^{\frac{p-1}{d}-1} \left(\frac{p-1}{d} - 1\right)!.$$

Alternating and symmetric groups

Theorem (Chen-H. 2020+).

Let G be an almost simple primitive group with socle A_n and soluble stabiliser H. If $b(G) = 2$, then $(G, H, \mathrm{val}(G, H))$ is listed in the following.

G	H	$\mathrm{val}(G, H)$
A_5	S_3	6
M_{10}	$\mathrm{AGL}_1(5)$	20
M_{10}	8:2	32
$\mathrm{PGL}_2(9)$	D_{16}	16
A_9	$\mathrm{ASL}_2(3)$	432
A_p	$\mathbb{Z}_p{:}\mathbb{Z}_{(p-1)/2}$	see above
S_p	$\mathrm{AGL}_1(p)$	see above

Prime valency

Proposition (Burness-Giudici 2020 [3]).

Suppose G is transitive with $b(G) = 2$ and $\Sigma(G)$ is the Saxl graph of G. Then $\Sigma(G)$ has prime valency p if and only if G is one of the following:

1. $G = \mathbb{Z}_p \wr \mathbb{Z}_2$ and $\Sigma(G) \cong K_{p,p}$.
2. $G = S_3$, $p = 2$ and $\Sigma(G) \cong K_3$.
3. $G = \mathrm{AGL}_1(2^f)$, where $p = 2^f - 1$ is a Mersenne prime and $\Sigma(G) \cong K_{p+1}$.

Prime-power valency

Proposition.

Let G be an almost simple primitive group with stabiliser H. If $|H|$ is a prime power, then H is a 2-group and (G, H) is listed in the following.

G	H	Conditions
$\mathrm{L}_2(p)$	D_{p-1}	$p \geq 17$ is a Fermat prime
	D_{p+1}	$p \geq 31$ is a Mersenne prime
$\mathrm{PGL}_2(p)$	$D_{2(p-1)}$	$p \geq 17$ is a Fermat prime
	$D_{2(p+1)}$	$p \geq 7$ is a Mersenne prime
$\mathrm{PGL}_2(9)$	D_{16}	
M_{10}	$8{:}2$	
$\mathrm{P\Gamma L}_2(9)$	8.2^2	
$\mathrm{Aut}(\mathrm{L}_3(2))$	D_{16}	

Table: Almost simple groups G with a maximal subgroup H of prime-power order

Prime-power valency

Theorem (Chen-H. 2020+).

Suppose G is almost simple primitive with $b(G) = 2$ stabiliser H. Then the Saxl graph $\Sigma(G)$ has prime-power valency if and only if (G, H) is one of the following:

1. $(G, H) = (\mathrm{M}_{10}, 8{:}2)$ and $\mathrm{val}(G, H) = 32$.
2. $(G, H) = (\mathrm{PGL}_2(q), D_{2(q-1)})$, where $q \geq 17$ is a Fermat prime or $q = 9$, $\Sigma(G)$ is isomorphic to the Johnson graph $J(q+1, 2)$ and $\mathrm{val}(G, H) = 2(q-1)$.

Prime-power valency

Theorem (Chen-H. 2020+).

Suppose G is almost simple primitive with $b(G) = 2$ stabiliser H. Then the Saxl graph $\Sigma(G)$ has prime-power valency if and only if (G, H) is one of the following:

1. $(G, H) = (\mathrm{M}_{10}, 8{:}2)$ and $\mathrm{val}(G, H) = 32$.
2. $(G, H) = (\mathrm{PGL}_2(q), D_{2(q-1)})$, where $q \geq 17$ is a Fermat prime or $q = 9$, $\Sigma(G)$ is isomorphic to the Johnson graph $J(q + 1, 2)$ and $\mathrm{val}(G, H) = 2(q - 1)$.

General primitive groups with prime-power valency?

Example.

- $\mathrm{val}(\mathrm{PSU}_3(2), Q_8) = 8$.
- $\mathrm{val}(\mathrm{M}_{10} \wr C_2, (8{:}2) \wr C_2) = 2^9$, while $\mathrm{val}(\mathrm{M}_{10} \wr C_4, (8{:}2) \wr C_4) = 2^{18} \cdot 3$.

Odd valency

Proposition (Burness-Giudici 2020 [3]).

Let G be an almost simple primitive group with stabiliser H and $b(G) = 2$. If $\mathrm{val}(G, H)$ is odd then one of the following holds:

1. $(G, H) = (\mathrm{M}_{23}, 23{:}11)$.
2. $(G, H) = (A_p, \mathbb{Z}_p{:}\mathbb{Z}_{(p-1)/2})$, where $p \equiv 3 \pmod 4$ is a prime and $(p-1)/2$ is composite.
3. $\mathrm{L}_r^\epsilon(q) \leq G \leq \mathrm{P\Gamma L}_r^\epsilon(q)$ with r an odd prime and $G \neq \mathrm{L}_r^\epsilon(q)$. The stabiliser H is the $\mathscr{C}_3$-subgroup of G.

Odd valency

Case (2) can be easily shown impossible by above. Moreover, we analysis the case when $G = \mathrm{PGL}_r^{\epsilon}(q)$. These lead the following.

Theorem (Chen-H. 2020+).

Let G be an almost simple primitive group with stabiliser H and $b(G) = 2$. Then $\mathrm{val}(G, H)$ is odd only if one of the following holds:

1. $G = \mathrm{M}_{23}$ and $H = 23{:}11$.
2. $\mathrm{L}_r^{\epsilon}(q) \leq G \leq \mathrm{P\Gamma L}_r^{\epsilon}(q)$ with r an odd prime and $G \not\leq \mathrm{PGL}_r^{\epsilon}(q)$. The stabiliser H is the $\mathscr{C}_3$-subgroup of G.

Outline

1 Backgrounds

2 Our Results

3 Problems

A conjecture on arc stabilisers

To calculate the valency we need to determine all possible arc stabilisers $G_{(\alpha,\alpha^g)}$ for $g \in G$. This leads the following conjecture, which may be of independent interest.

Conjecture.

Let G be a finite primitive permutation group with stabiliser G_α. Then for any $g \notin G_\alpha$, either $G_{(\alpha,\alpha^g)} = 1$ or $G_{(\alpha,\alpha^g)}$ is not normal in G_α.

The conjecture is verified when:

- $G_{(\alpha,\alpha^g)} < G_{\{\alpha,\alpha^g\}}$;
- $|\Omega| \leq 4095$;
- $G_{(\alpha,\alpha^g)}$ has odd order.

Burness-Giudici Conjecture

Conjecture (Burness-Giudici 2020 [3]).

Let G be primitive and $b(G) = 2$. Then any two vertices in $\Sigma(G)$ has a common neighbour.

The conjecture is verified when:

- $\mathrm{soc}(G) = A_n$ and $H \cap \mathrm{soc}(G)$ acts primitively on $\{1, \ldots, n\}$.
- $\mathrm{soc}(G)$ is in a collection of sporadic simple groups.
- Chen-Du 2020+ [7]: $\mathrm{soc}(G) = \mathrm{PSL}_2(q)$.

Connectivity

- How to characterise the connectivity of Saxl graphs of transitive permutation groups? We know that

$$G \text{ primitive} \implies \Sigma(G) \text{ connected.}$$

The converse? Simple quasi-primitive groups?

Connectivity

- How to characterise the connectivity of Saxl graphs of transitive permutation groups? We know that

$$G \text{ primitive} \implies \Sigma(G) \text{ connected.}$$

The converse? Simple quasi-primitive groups?

- When does $\mathrm{val}(G, H) = |H|$? That is, there is exactly one regular suborbit, especially when G is primitive.

Example.

When $(G, H) = (\mathrm{PGL}_2(q), D_{2(q-1)})$ for $q \geq 5$ we have $\mathrm{val}(G, H) = |H|$.

Automorphisms

- We have $G \leq \mathrm{Aut}(\Sigma(G))$. When does $G = \mathrm{Aut}(\Sigma(G))$?

Example.

- When $(G, H) = (\mathrm{Sp}_{2m}(2), S_{2m+2})$ with $m \geq 6$ even, $G = \mathrm{Aut}(\Sigma(G))$.
- When $(G, H) = (\mathrm{PGL}_2(q), D_{2(q-1)})$ with $q \geq 7$, we have $\Sigma(G) \cong J(q+1, 2)$ and so $G < \mathrm{Aut}(\Sigma(G)) \cong S_{q+1}$.

Automorphisms

- We have $G \leq \mathrm{Aut}(\Sigma(G))$. When does $G = \mathrm{Aut}(\Sigma(G))$?

Example.

- When $(G, H) = (\mathrm{Sp}_{2m}(2), S_{2m+2})$ with $m \geq 6$ even, $G = \mathrm{Aut}(\Sigma(G))$.
- When $(G, H) = (\mathrm{PGL}_2(q), D_{2(q-1)})$ with $q \geq 7$, we have $\Sigma(G) \cong J(q+1, 2)$ and so $G < \mathrm{Aut}(\Sigma(G)) \cong S_{q+1}$.

- To what extent does $\Sigma(G)$ determine G up to permutation isomorphism?

Automorphisms

- We have $G \leq \mathrm{Aut}(\Sigma(G))$. When does $G = \mathrm{Aut}(\Sigma(G))$?

Example.

- When $(G, H) = (\mathrm{Sp}_{2m}(2), S_{2m+2})$ with $m \geq 6$ even, $G = \mathrm{Aut}(\Sigma(G))$.
- When $(G, H) = (\mathrm{PGL}_2(q), D_{2(q-1)})$ with $q \geq 7$, we have $\Sigma(G) \cong J(q+1, 2)$ and so $G < \mathrm{Aut}(\Sigma(G)) \cong S_{q+1}$.

- To what extent does $\Sigma(G)$ determine G up to permutation isomorphism?
- When is $\Sigma(G)$ Cayley? That is, when $\mathrm{Aut}(\Sigma(G))$ has a regular subgroup?

Example.

- When $(G, H) = (\mathrm{M}_{10}, 8{:}2)$, $\Sigma(G)$ is not Cayley.
- When $(G, H) = (S_7, \mathrm{AGL}_1(7))$, $\Sigma(G)$ is Cayley.

Cycles

- Euler cycle? The only known genuine example of almost simple primitive group with odd valency is M_{23} with stabiliser 23:11.

Conjecture.

Let G be an almost simple primitive group with stabiliser H. Then $\mathrm{val}(G, H)$ is odd if and only if $G = \mathrm{M}_{23}$ and $H = 23{:}11$.

Cycles

- Euler cycle? The only known genuine example of almost simple primitive group with odd valency is M_{23} with stabiliser 23:11.

Conjecture.

Let G be an almost simple primitive group with stabiliser H. Then $\mathrm{val}(G, H)$ is odd if and only if $G = \mathrm{M}_{23}$ and $H = 23{:}11$.

- Hamiltonian cycle? Note that $\Sigma(G)$ is G-vertex-transitive.

Lemma.

All the known examples of vertex-transitive non-Hamiltonian graphs of order at least 3 are cubic, and hence not Saxl graphs of transitive groups.

Other problems

- When is a vertex-transitive graph the Saxl graph of a transitive group?

Example.

- Most vertex-transitive graphs with prime valency are not.
- The Johnson graph $J(q+1,2)$ for any prime-power $q \geq 5$ is isomorphic to the Saxl graph of $\mathrm{PGL}_2(q)$ with stabiliser $D_{2(q-1)}$.

Other problems

- When is a vertex-transitive graph the Saxl graph of a transitive group?

Example.

- Most vertex-transitive graphs with prime valency are not.
- The Johnson graph $J(q+1,2)$ for any prime-power $q \geq 5$ is isomorphic to the Saxl graph of $\mathrm{PGL}_2(q)$ with stabiliser $D_{2(q-1)}$.

- Properties of Saxl hypergraphs (vertex set Ω and edges are bases)?

Other problems

- When is a vertex-transitive graph the Saxl graph of a transitive group?

Example.

- Most vertex-transitive graphs with prime valency are not.
- The Johnson graph $J(q+1,2)$ for any prime-power $q \geq 5$ is isomorphic to the Saxl graph of $\mathrm{PGL}_2(q)$ with stabiliser $D_{2(q-1)}$.

- Properties of Saxl hypergraphs (vertex set Ω and edges are bases)?
- Other invariants of graphs:
  - chromatic number;
  - total domination number;
  - independence number;
  - spectrum.
